

My New Growing Colony: Earth 2

Your spaceship crashes and your followers are starting a community in one of the following areas on newly discovered Earth 2:

- 1) Hot Desert
- 2) Arctic Tundra
- 3) Rainforest Tropical
- 4) Grassland
- 5) Ocean areas with very tiny little spotted islands

You have to find a way to feed your people and thrive, but you wish to keep this habitat sustainable and want to damage the natural landscape and wildlife as little as possible (preserve and conserve).

Animals discovered will be very similar to ones back on earth, but they look very different.

Example: Cattle normally graze in grasslands, in Australia Kangaroo fill in the niche of cows in Europe.

- 1) What do you have to keep track of as your population grows and changes?
 - a) 20 people.
 - b) 100 people.
 - c) 1000 people.
- 2) What will you feed your people, how will you keep this sustainable, where will wastes go, what will you build shelters out of, clothing, etc?
- 3) You do have grain to use for food with you in the spaceship, but certain varieties grow in certain places better than others.
- 4) You have brought the following non-native species such as “bull frog, domesticated cat, rabbit, and salmon” These animals were in suspended animation, but will be thawed out since your ship is totalled.
